SCENARIO

Reporting, validating, submitting, and tracking an employee issue in ServiceNow

Entice

How does an employee initially encounter an issue and seek support?

Enter

What do employees experience as they enter the Service Portal?

Engage

In the core moments of completing the Record Producer, what happens?

Exit

What do employees typically experience as submission finishes?

Extend

What happens in the backend table after the issue is submitted?

Steps

What does the employee (or support team) typically experience?

Encounter workplace issue	Open Requesting portal	View portal homepage	Read Commercial widget	Click 'Raise Ticket →'	Load Record Producer	Select Requester & Category	Set State & Description	Submit issue form	Generate Ticket Number	Enforce UI Policies & Rules	Triage & Group Assignment	Track State to Resolution
Employee faces a VPN drop, laptop fault, server error, password lockout, or HR policy question during work.	Employee navigates to /employee_request in browser instead of sending an unstructured email.	Portal loads Employee Center Coral Theme, Employee Center Menu, and the 6×6 homepage grid.	Employee views the left gradient banner highlighting 24/7 Support, Faster Resolution & Tracking.	Employee clicks the right Link redirect widget card to start a structured issue request.	AngularJS controller routes to sp?id=sc_cat_item and loads the 'Raise Employee Issue' form.	Employee selects Requester (Order 100), Category (Order 200), and Subcategory (Order 300).	Employee sets State to New (Order 400) and enters a mandatory Short description (Order 500).	Employee clicks Submit on the Record Producer to log the workplace issue into ServiceNow.	ServiceNow creates a record in 'Employee raises issue' with an auto-generated unique Number.	Table UI Policies lock Number as Read-only, enforce Short description on New & validate Category.	Support team sets Priority (Critical to Low) and routes record to Assignment Group (sys_user_group).	Ticket progresses from New → In progress → Resolved → Closed with complete audit visibility.

Interactions

What interactions do they have at each step along the way?

- People: Employee, HR, IT Support
- Places: /employee_request & Studio
- Things: Widgets, Record Producer, UI Policies & Scoped Table

Employee workstation or laptop; previously relied on informal Outlook/Gmail emails or chat pings	Web browser accessing Service Portal URL suffix: /employee_request (Requesting portal)	Employee Center Portal Page (employee_center_portal_page) with Employee Center Coral Theme	Left 6-column container: 'Commercial widget' (HTML5 list + 135deg green→white→blue CSS gradient)	Right 6-column container: 'Link redirect' widget (ng-click='c.openRecordProducer()') Client Script invokes $location.url('sp?id=sc_cat_item&sys_id=' + RECORD_PRODUCER_SYS_ID)	Service Catalog → Service category → 'Raise Employee Issue' Record Producer (sc_cat_item)	Variables Order 100 (Requester → sys_user), Order 200 (Category), Order 300 (Subcategory) 4 Valid Pairs: Network→VPN, Hardware→Laptop, Software→Server, Access→Forgot password	Variables Order 400 (State: New, In progress, Resolved, Closed) & Order 500 (Short description)	Service Portal Catalog Submit button mapping all 5 variables directly to backend table columns	Scoped Application: 'Employee Center' → Custom Table: 'Employee raises issue' (Auto-number enabled)	UI Policy 1: Mandatory Short description when State is New; UI Policy 2: Read-only Number Dictionary Configure → Advanced view: Subcategory Dependent on Category	Backend Form Design fields: Priority (Critical, High, Medium, Low) & Assignment Group (sys_user_group)	IT & HR Support Engineers updating State (In progress → Resolved → Closed) on backend table

Goals & motivations

At each step, what is a person's primary goal or motivation? ("Help me..." or "Help me avoid...")

Help me report my VPN, laptop, server, or HR issue quickly so I can get back to work	Help me find one official support portal instead of guessing which email address to message	Help me see clearly what IT & HR support services are offered on the homepage	Help me feel confident that 24/7 support and transparent tracking are available	Help me open the issue submission form in a single click without searching menus	Help me fill out a simple, guided questionnaire rather than a raw database form	Help me pick the right Category and matching Subcategory without confusion	Help me provide a clear summary so support doesn't have to email me back for details	Help me submit my issue without form errors or lost inputs	Help me get a unique, tamper-proof ticket Number immediately for my records	Help support teams receive complete, validated data on every single ticket	Help route urgent issues to the right Assignment Group based on Priority	Help me know when my issue moves from New to In progress, Resolved, and Closed

Positive moments

What steps does a typical user find productive, reassuring, motivating, or seamless?

		Employee Center Coral Theme and 6×6 layout create a modern, welcoming self-service portal	Commercial widget clearly communicates 24/7 support, faster resolution & transparent tracking	Single-click 'Raise Ticket →' button routes directly to the Record Producer form		Controlled Category → Subcategory mapping prevents mismatched ticket classifications			Auto-numbering and read-only Number UI Policy give instant, reliable reference IDs		Structured 8-field table eliminates manual email copying for HR and IT teams	Standardized State lifecycle (New → Closed) provides end-to-end resolution visibility

Negative moments

What steps or misconfigurations can cause friction, delays, or errors?

Informal email reporting previously caused long delays and zero status visibility		Phase 5 & 6 portal homepage IDs (ec_standard_home vs employee_center_portal_page) must be aligned		Right 'Link redirect' widget story omits CSS snippet; requires custom CSS to match left widget	Hardcoded RECORD_PRODUCER_SYS_ID fails if not updated to the target PDI's actual sys_id		Table UI Policies apply on the backend form; catalog intake benefits from Catalog UI Policies too				Priority & Assignment Group are omitted from the 5 Record Producer variables and set post-intake	

Areas of opportunity

How might we make each step better? What ServiceNow enhancements can we add?

	How might we auto-redirect employees from legacy support email addresses to /employee_request?	Could we align the Requesting portal homepage directly to employee_center_portal_page by default?		How might we style the Link redirect widget with matching 14px border-radius and hover elevation?	Could we pass RECORD_PRODUCER_SYS_ID dynamically via Widget Instance Options instead of hardcoding?	How might we auto-populate Requester (Order 100) with the logged-in user via gs.getUserID()?			Could we trigger a Flow Designer email confirmation containing the new Ticket Number upon submit?		How might we auto-assign Assignment Group and Priority based on the selected Category?	Could we add a 'My Submitted Issues' tracking widget directly on the /employee_request homepage?
