Project Design Phase-II
Data Flow Diagram & User Stories

Date	22 October 2026
Team ID	Individual (Abdul Khadarvali)
Project Name	Employee Raise Issue – Record Producer & Service Portal Integration Guide
Maximum Marks	4 Marks

Data Flow Diagrams:

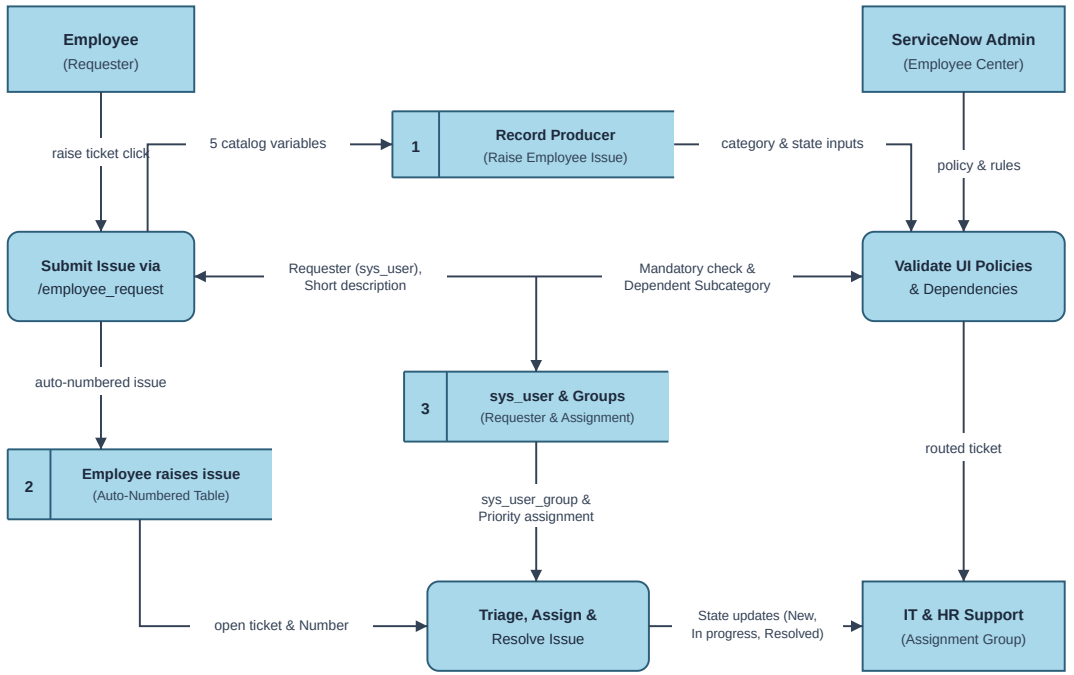

A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. A neat and clear DFD can depict the right amount of the system requirement graphically. It shows how data enters and leaves the system, what changes the information, and where data is stored.

System Flow: (Simplified)

1. Employee navigates to the /employee_request Service Portal homepage and views the 6*6 grid (Commercial widget & Link redirect widget).
2. Clicking “Raise Ticket ->” invokes AngularJS $location.url() to open the Raise Employee Issue Record Producer (sp?id=sc_cat_item).
3. Employee completes the 5 mapped variables (Requester, Category, Subcategory, State, Short description at Orders 100–500).
4. UI Policies enforce Mandatory Short description (when State is New), Read-only Number, and Category → Subcategory choice dependency.
5. Record is saved in the Employee raises issue table and routed to the Assignment Group (sys_user_group) for resolution.

Project DFD Level 0 & Level 1 (Industry Standard Notation)

User Stories

Use the below template to list all the user stories for the product (Employee Raise Issue – 8 Phases / 13 Stories).

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
Administrator (ServiceNow Studio)	Phase 1: Creating a Custom Application	**USN-1**	As a ServiceNow administrator, I can create a Scoped Application named `Employee Center` in ServiceNow Studio so all project artifacts are isolated.	`Employee Center` appears as the active Scoped Application upon reloading the main ServiceNow interface.	High	Sprint-1
	Phase 2: Creating a Custom Table and Fields	**USN-2**	As an administrator, I can create a custom table labeled `Employee raises issue` under `System Definition → Tables` with `Auto number` enabled.	Table is saved in `Employee Center` scope and automatically generates sequential ticket numbers.	High	Sprint-1
		USN-3	As an administrator, I can configure 8 fields via Form Design: `Number`, `Requester` (`sys_user`), `Category`, `Subcategory`, `Short description`, `State`, `Priority`, and `Assignment Group` (`sys_user_group`).	All 8 fields render on the form with exact choice values (`Network`, `Hardware`, `Software`, `Access`) and reference lookups.	High	Sprint-1
	Phase 3: Creating UI Policies and Dependency	**USN-4**	As an administrator, I can create a UI Policy on `Employee raise issue` with condition `State is New` that makes `Short description` mandatory.	When `State` is set to `New`, the form blocks submission unless `Short description` is populated.	High	Sprint-1
		USN-5	As an administrator, I can create a UI Policy (`Number field will read only`) with no filter condition to lock the `Number` field.	The `Number` field is strictly read-only across all new and existing issue records.	High	Sprint-1
		USN-6	As an administrator, I can configure Dictionary Dependency on `Subcategory` dependent on `Category` in Advanced view.	Selecting `Network` shows VPN; `Hardware` shows `Laptop`; `Software` shows `Server`; `Access` shows `Forgot password`.	High	Sprint-1
Employee (Service Portal Web User)	Phase 4: Creating a Record Producer	**USN-7**	As an employee, I can submit workplace issues via the `Raise Employee Issue` Record Producer under `Service Catalog → Service` using 5 guided questions (`Order` 100–500).	Submitting the 5 variables (`Requester`, `Category`, `Subcategory`, `State`, `Short description`) creates a mapped record in `Employee raises issue`.	High	Sprint-1
	Phase 5: Creating a new Service Portal	**USN-8**	As an employee, I can access a dedicated Service Portal titled `Requesting portal` at URL suffix `/employee_request` styled with `Employee Center Coral Theme`.	Navigating to `/employee_request` loads the portal with `ec_standard_home`, `Employee Center Menu`, and `esc_knowledge_home`.	Medium	Sprint-2
		USN-9	As a portal administrator, I can create a custom portal page titled `Employee Center Portal Page` (`ID: employee_center_portal_page`).	Page record is saved under `Service Portal → Pages` and ready for widget layout in Designer.	Medium	Sprint-2
Portal Developer	Phase 6: Creating Widgets and Adding to the Page	**USN-10**	As a portal developer, I can create the left `Commercial widget` with HTML service highlights and a 135-degree CSS linear-gradient background.	`Commercial widget` renders the 4 service bullet points (24/7 Support, Faster Resolution, Transparent Tracking, Secure & Reliable).	Medium	Sprint-2

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
		USN-11	As a portal developer, I can create the right `Link redirect` widget with an AngularJS Client Script (`c.openRecordProducer()`) and place both widgets in a `6*6` grid container.	Clicking `Raise Ticket ->` executes `$location.url('sp?id=sc_cat_item&sys_id=' + RECORD_PRODUCER_SYS_ID)` and opens the Record Producer.	High	Sprint-2
IT / HR Support & QA Reviewer	Phase 7 & 8: Testing, Validation and Conclusion	**USN-12**	As a QA tester, I can navigate to `/employee_request`, verify the floating left and right widgets, click `Raise Ticket ->`, and submit a test issue.	Record is created in `Employee raises issue` and enforces UI Policy and dictionary restrictions on the form.	High	Sprint-2
		USN-13	As an IT/HR support engineer (`sys_user_group`), I can review standardized incoming issue records, set `Priority`, and update `State` through to `Resolved` and `Closed`.	Support teams triage and resolve issues from a single governed table without manual email tracking.	High	Sprint-2
